**Header** :RENZACCI STRESSES THE VERSATILITY OF ITS  
CONDENSING TUMBLE DRYERS

Renzacci UK plc, sole UK importer of Italian-built laundry and dry cleaning equipment from Renzacci S.p.A. regards the Company's new RZ Plus range of condensing tumble dryers as probably the most important advance in tumble dryer design in recent years.

### **RZ Plus Series**

The RZ Plus is a range of condensing tumble dryers which requires no external ducting, making them appropriate for areas with no ready egress for exhaust fumes. They will appeal to operators who are currently unable to install tumble dryers in areas with no external wall, such as a basement or because of planning constraints or the sheer costs of such a procedure.

Just such conditions were encountered recently at BAA's new flagship Terminal 5. There was a requirement to dry the uniforms of many of the terminal's ground crew, but the installation site had no suitable outside wall to vent the machine exhausts. Ten Renzacci RZ 35 Plus tumble dryers were installed and efficiently solved the problem.

RZ Plus dryers, which are available in 35 and 55lb capacities, operate using refrigeration, a method that is particularly efficient and assures quick drying while reducing energy consumption to the minimum. The system works by means of a built-in heat pump and the recovery and continuous re-

circulation of air within the dryer, which together eliminates the need for an outside exhaust vent. Because of this advanced closed circuit technology, operators are getting a commercial quality dryer capable of generating energy savings of up to 50 per cent compared to a normal electric dryer or 25 per cent over a steam-fed system.

Says Renzacci UK Managing Director, Jason Alexander: "You could expect to pay a high price in terms of purchase cost and operating efficiency for such versatility and innovation. In fact, with the RZ Plus range the reverse is true. The Renzacci range of condensing tumble dryers ranks amongst the most competitively priced tumble dryers of their type on the UK market. Add to that the energy efficiency of these modern machines and you will see that they are environmentally friendly and could qualify for a Carbon Trust Loan, too.

As a rule of thumb, the more advanced the machine, the more energy efficient it will be. You may pay a small premium for this technology, compared with regular vented dryers, but in the present climate of high fuel costs, that will prove to be money well invested. The cost of running a machine is now every bit as important as the initial investment. Operators should factor into their purchase decision the running costs of the equipment over, say, a 5-year period. The secret of Renzacci tumble dryers is their ability to maintain a balance between efficiency and energy consumption on the one hand and drying capacity on the other."
