PRESS RELEASE

Issue Date :25th July 2006

Header :New combined Perc Monitor and Leak Detector from Renzacci UK Plc and Aeroqual.

Renzacci UK plc is delighted to announce the addition of a combined air monitor and Perc detector to its hugely successful range of Aeroqual monitoring devices.

The dual sensor combines both ambient air monitoring and Perc detection facilities in a single boxed unit without the need to change or adapt heads. Specifically developed for use in drycleaning outfits, the combined monitor is available two versions - the base Series 200 and the top of the range Series 500.

Jason Alexander, managing director of Renzacci UK plc comments: “The advantage of this new dual unit is in its versatility and ease of use. It can be wall mounted to monitor ambient air quality or lifted and used as a handheld device to check for area specific leaks of Perc around the drycleaning machine.

“This makes it very easy for drycleaners to ensure that they are meeting the standards of the SED (Solvent Emissions Directive) and operating safe work environments. The units have been designed for simplicity of operation so that readings can be taken and understood by all levels of staff.”

Compact and easy to use, the Series 200 and Series 500 combine high accuracy with fast response to changes in chemical levels in the atmosphere. Boxes measure 195 by 122 by 54mm and display data via large easily read screen. In handheld mode, the units operate on a rechargeable battery with a life of seven hours and come supplied with a recharger.

The Series 500 monitor also incorporates onboard data logging and can be interfaced with a PC. Up to 8000 recordings can be stored on the Series 500 before it becomes necessary to download.

Jason Alexander continues, “We were determined to bring the most accurate monitoring technology to a form that was accessible for small business users. Aeroqual monitors have allowed us to do just this and the take-up we have had in the months since its introduction has been phenomenal. Independent
