**Header :RENZACCI UK PLC EXTENDS DISTRIBUTORSHIP OF
AEROQUAL PRODUCTS TO IRELAND**

Following the successful introduction by Renzacci UK plc of the Aeroqual Air Monitoring system to the United Kingdom, the company is pleased to announce the extension of its distribution agreement to cover the Republic of Ireland.

Renzacci UK managing director Jason Alexander comments, "As a result of the popularity of the monitors in the UK we have already had a great deal of interest expressed from clients within the Republic of Ireland."

"We were closely involved in the design of the SM70 Perchloroethylene and hydrocarbon monitor to ensure that it exactly fitted the needs of drycleaners to ensure that their machinery is operating in compliance with legal guidelines. In the first three months since we started offering the SM70 we have already installed more than 50 units and every single one has been performing to expectations. I think that figure speaks itself. We expect demand to grow in response to greater industry awareness of health and safety and as the deadline for compliance draws closer."

There are four basic monitors available plus a selection of additional tools and accessories.

The Model SM70 is a wall mounted fixed monitor that allows continuous ambient monitoring via a large easy-to-read digital display. The unit emits an audible alarm when the solvent-in-air concentration exceeds the set limit and may also be used for controlling external equipment. The SM70 is designed for simple operation with low maintenance and an AC power adapter is supplied.

Handheld monitors start with the entry level Series 200 monitor which incorporates similar features to the SM70 in portable format with a rechargeable battery (charger supplied). The Series 300 monitor includes additional features including an output facility to control external items of equipment. Top of the range is the Series 500 with onboard data logging and PC interface. Up to 8000 recordings can be stored on the Series 500 before it becomes necessary to download to a PC. The portable Perc monitors include a fast response sensor head (sub five seconds) which makes them ideal for performing spot leak checks.

PRESS RELEASE

Cambridge University and more recently the California-based Environmental Protection Agency have carried out separate tests which provide independent verification of the effectiveness and value for money of the Aeroqual monitors.

Jason Alexander adds, "These monitors represent a real advance in bringing the most sophisticated technology to a format where it can be understood and operated by non-specialists. What's more, at a very competitive price they are easily affordable by high street practitioners."
